

ADDING GOOGLE DIRECTORY CONTACTS TO YOUR IOS DEVICES

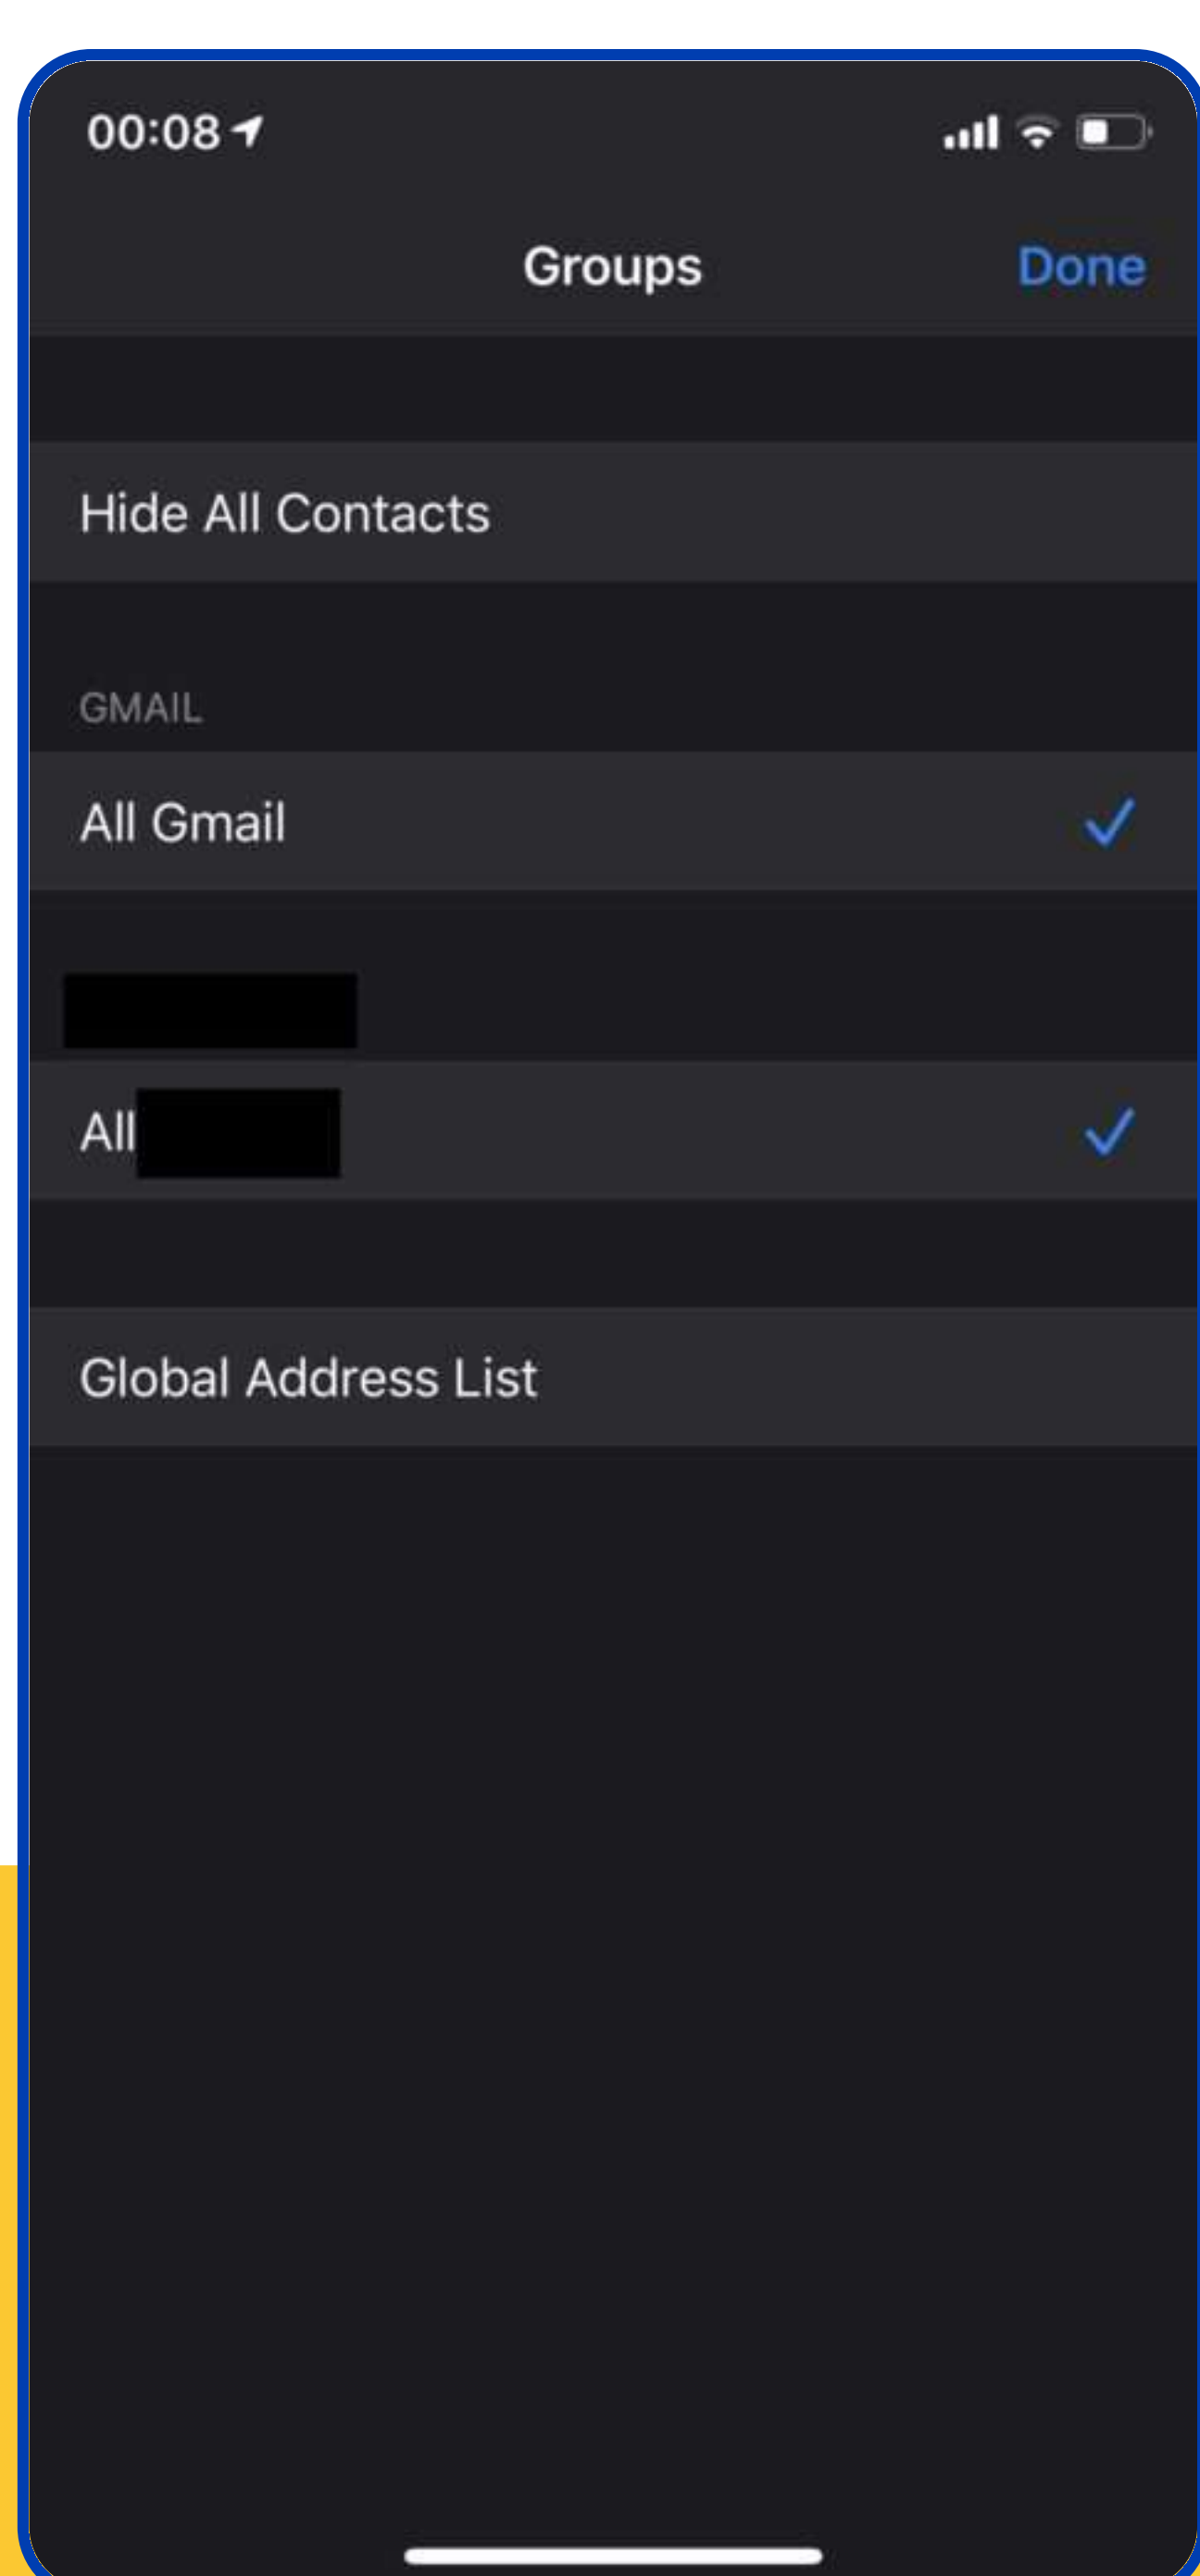

Managing different kinds of contacts on your Mac, iPhone or computers can be difficult, and it may require you to make several edits in the lists each time you want to add or delete a contact.

1 SYNC TO IOS DEVICE

There must be some way to sync Google Directory contacts to iOS devices? Right?

HOW TO

iOS Global Address List

On iOS the list only shows up if you go to Contacts -> Groups -> Global Address List and search for contacts within the Google Directory. It is not used to display information when you have an incoming call or in the call history lists etc. The directory is dormant until you bring it up on screen from its hidden location.

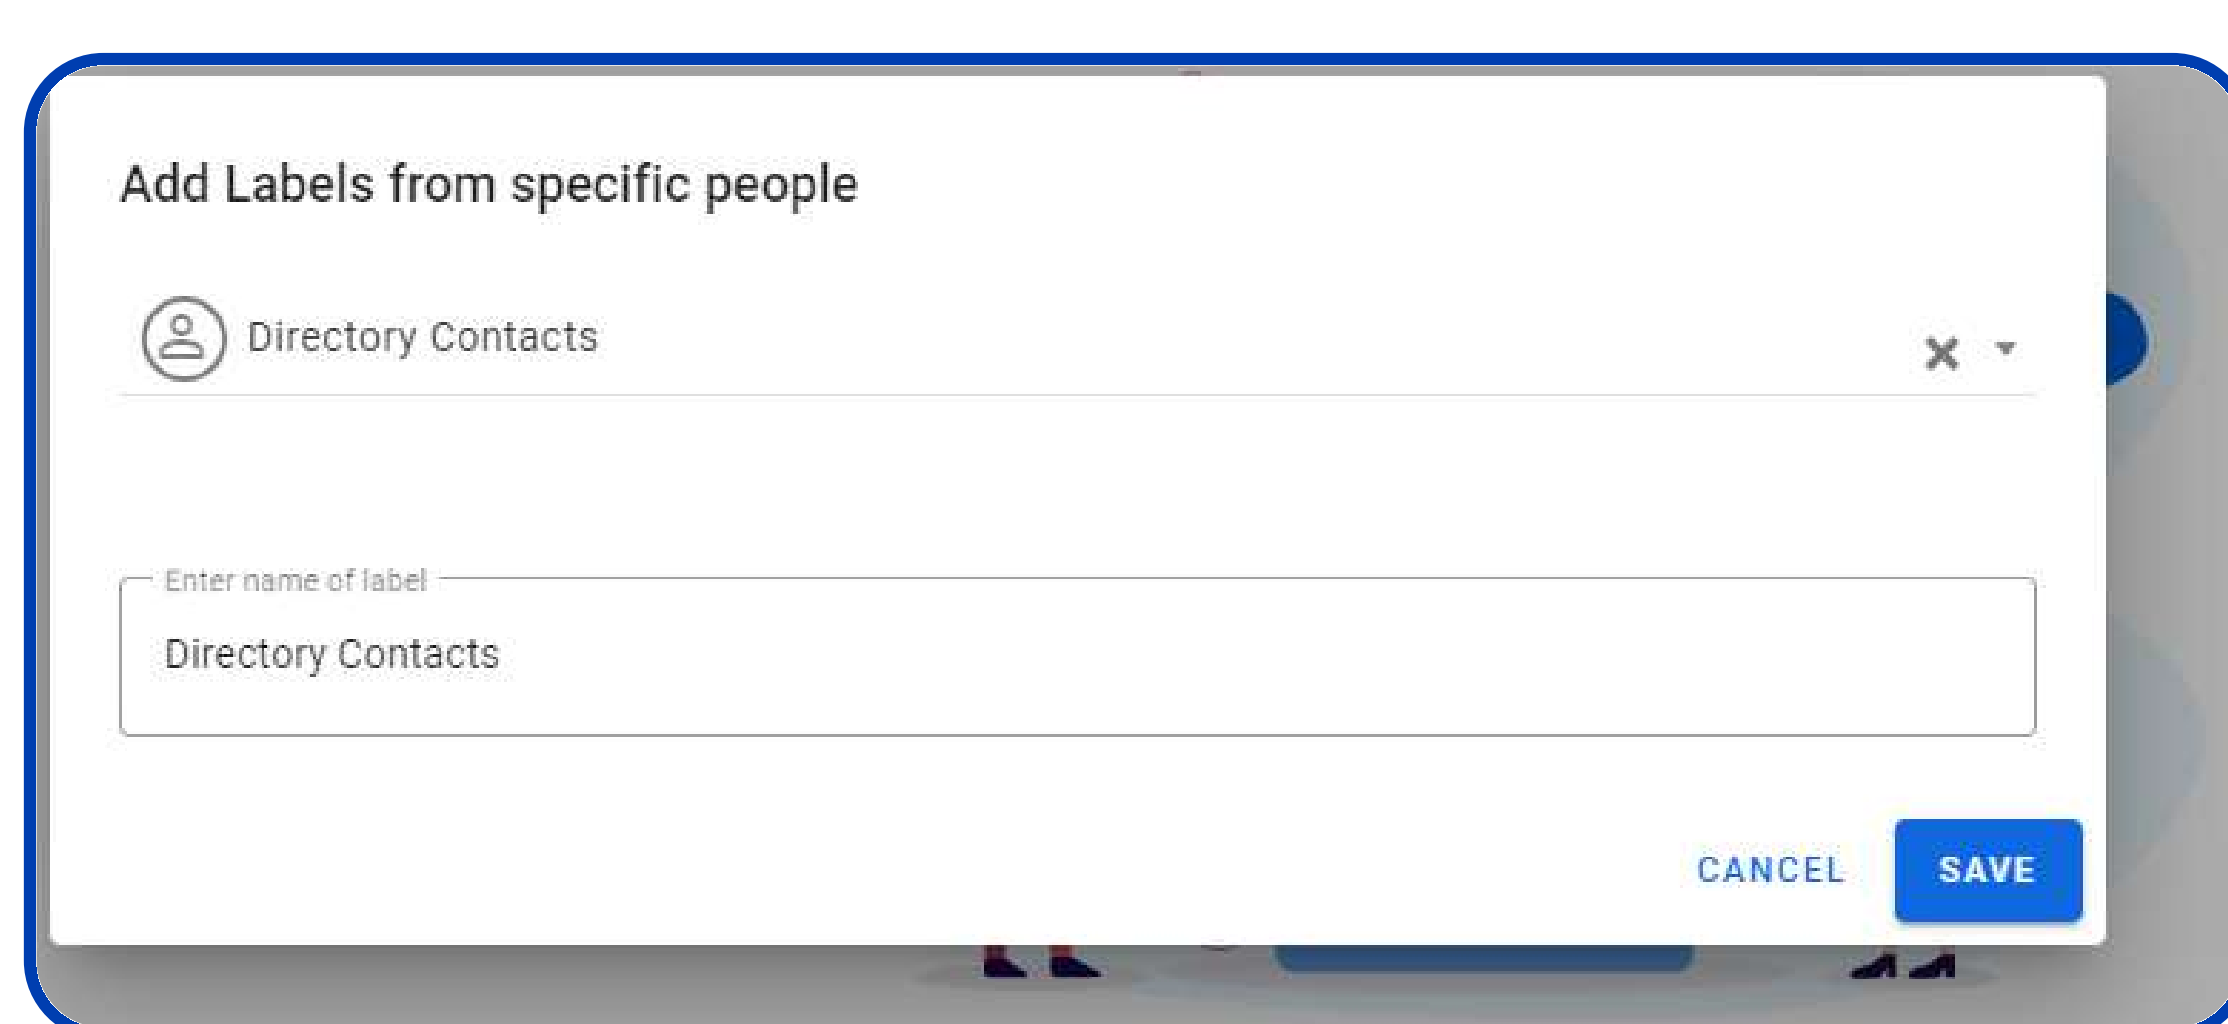

Furthermore, you cannot copy contacts in bulk from the Directory to your personal contact list using the Google Workspace web UI.

2 ADD GOOGLE DIRECTORY

So how do you get iOS users to have the same Google Directory contact access as their colleagues that are using Android and Google Contacts app?

HOW TO

Generic way to add google directory to iOS
Contacts > Groups > Global Address List > Search

Advanced way to add Google directory to iOS
Patronum > Automatically adds Google Directory contacts to iOS

You can customise which users receive the Directory contacts and also the name of the label that will be applied to their contacts.

Whenever a Google Directory contact is added or updated Patronum will update the user's Google Contacts.
